

A perspective on the current state of genomics

Matthew L. Settles, Ph.D.

Genome Center
University of California, Davis
settles@ucdavis.edu

Sequencing Platforms

- 1986 - Dye terminator Sanger sequencing, peaking at about 900kb/day in early 2000s

'Next' Generation

- 2005 – ‘Next Generation Sequencing’ as Massively parallel sequencing, both throughput and speed advances. The first was the Genome Sequencer (GS) instrument developed by 454 life Sciences (later acquired by Roche), Pyrosequencing 1.5Gb/day

Discontinued

Illumina (Solexa)

- 2006 – The second ‘Next Generation Sequencing’ platform. Now the dominant platform with 75% market share of sequencer and estimated >90% of all bases sequenced are from an Illumina machine, Sequencing by Synthesis > 1600Gb/day.

NovaSeq

HiSeq

Complete Genomics

- 2006 – Using DNA nanoball sequencing, has been a leader in Human genome resequencing, having sequenced over 20,000 genomes to date. In 2013 purchased by BGI and is now set to release their first commercial sequencer, the Revolocty. Throughput on par with HiSeq

DEFUNCT

Human genome/exomes only.

10,000 Human Genomes per year

Bench top Sequencers

❖ Life Technologies

- Ion Torrent
- Ion Proton
- Gene Studio S5

❖ Illumina

- MiSeq
- MiniSeq
- iSeq 100

The ‘Next, Next’ Generation Sequencers (3rd Generation)

- 2009 – Single Molecule Read Time sequencing by Pacific Biosystems, most successful third generation sequencing platforms, RSII ~2Gb/day, newer Pac Bio Sequel ~14Gb/day, near 100Kb reads.

[SMRT Sequencing](#)

Iso-seq on Pac Bio possible, transcriptome without ‘assembly’

Oxford Nanopore

- 2015 – Another 3rd generation sequencer, founded in 2005 and currently in beta testing. The sequencer uses nanopore technology developed in the 90's to sequence single molecules. Throughput is about 500Mb per flowcell, capable of near 200kb reads.

**Fun to play with but results
are highly variable**

[Nanopore Sequencing](#)

FYI: 4th generation sequencing is being described as In-situ sequencing

Bioinformatics

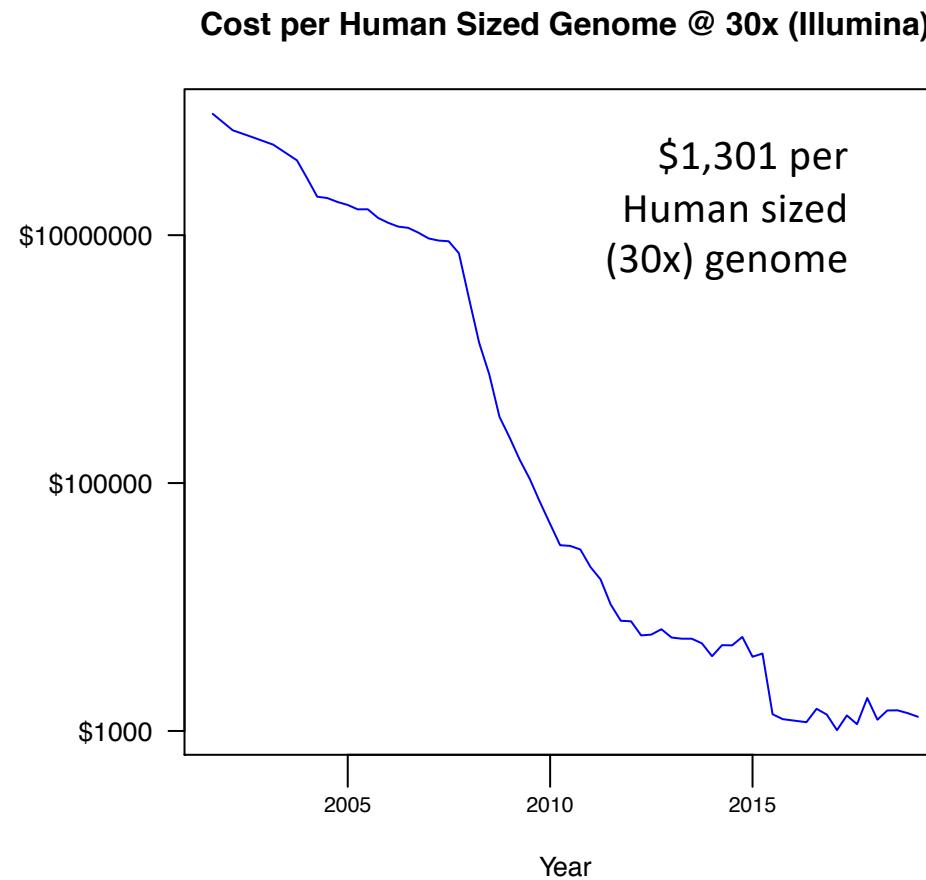

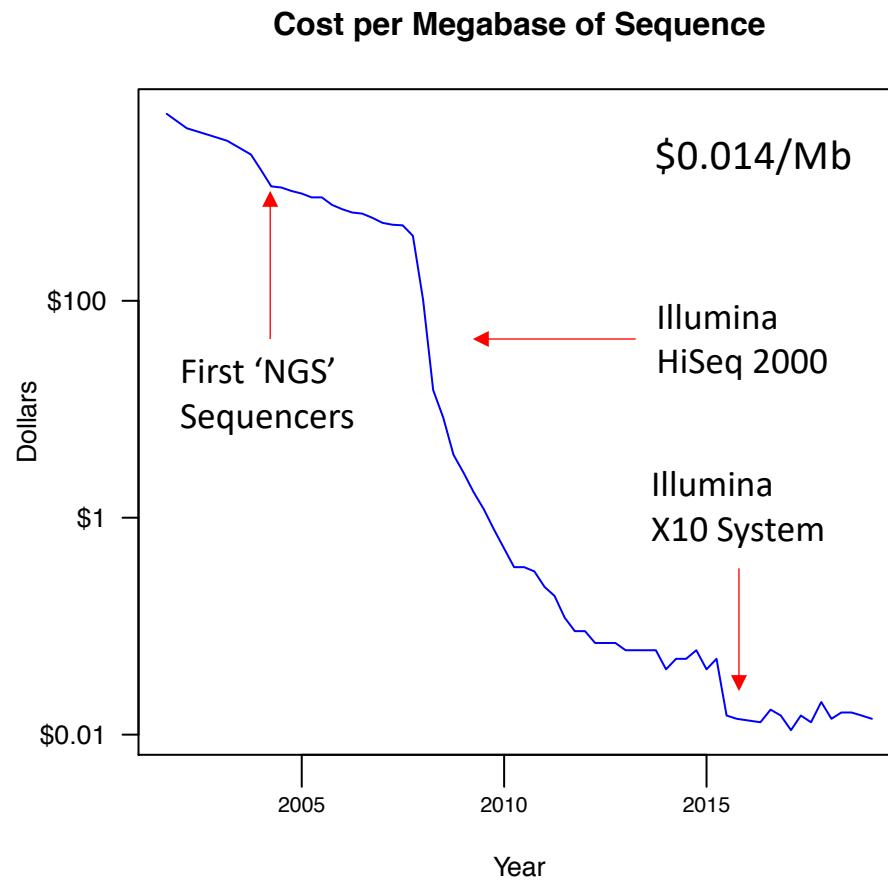

Old Way of
thinking about
Bioinformatics

Appro Cluster

Sequencing Costs

February 2019

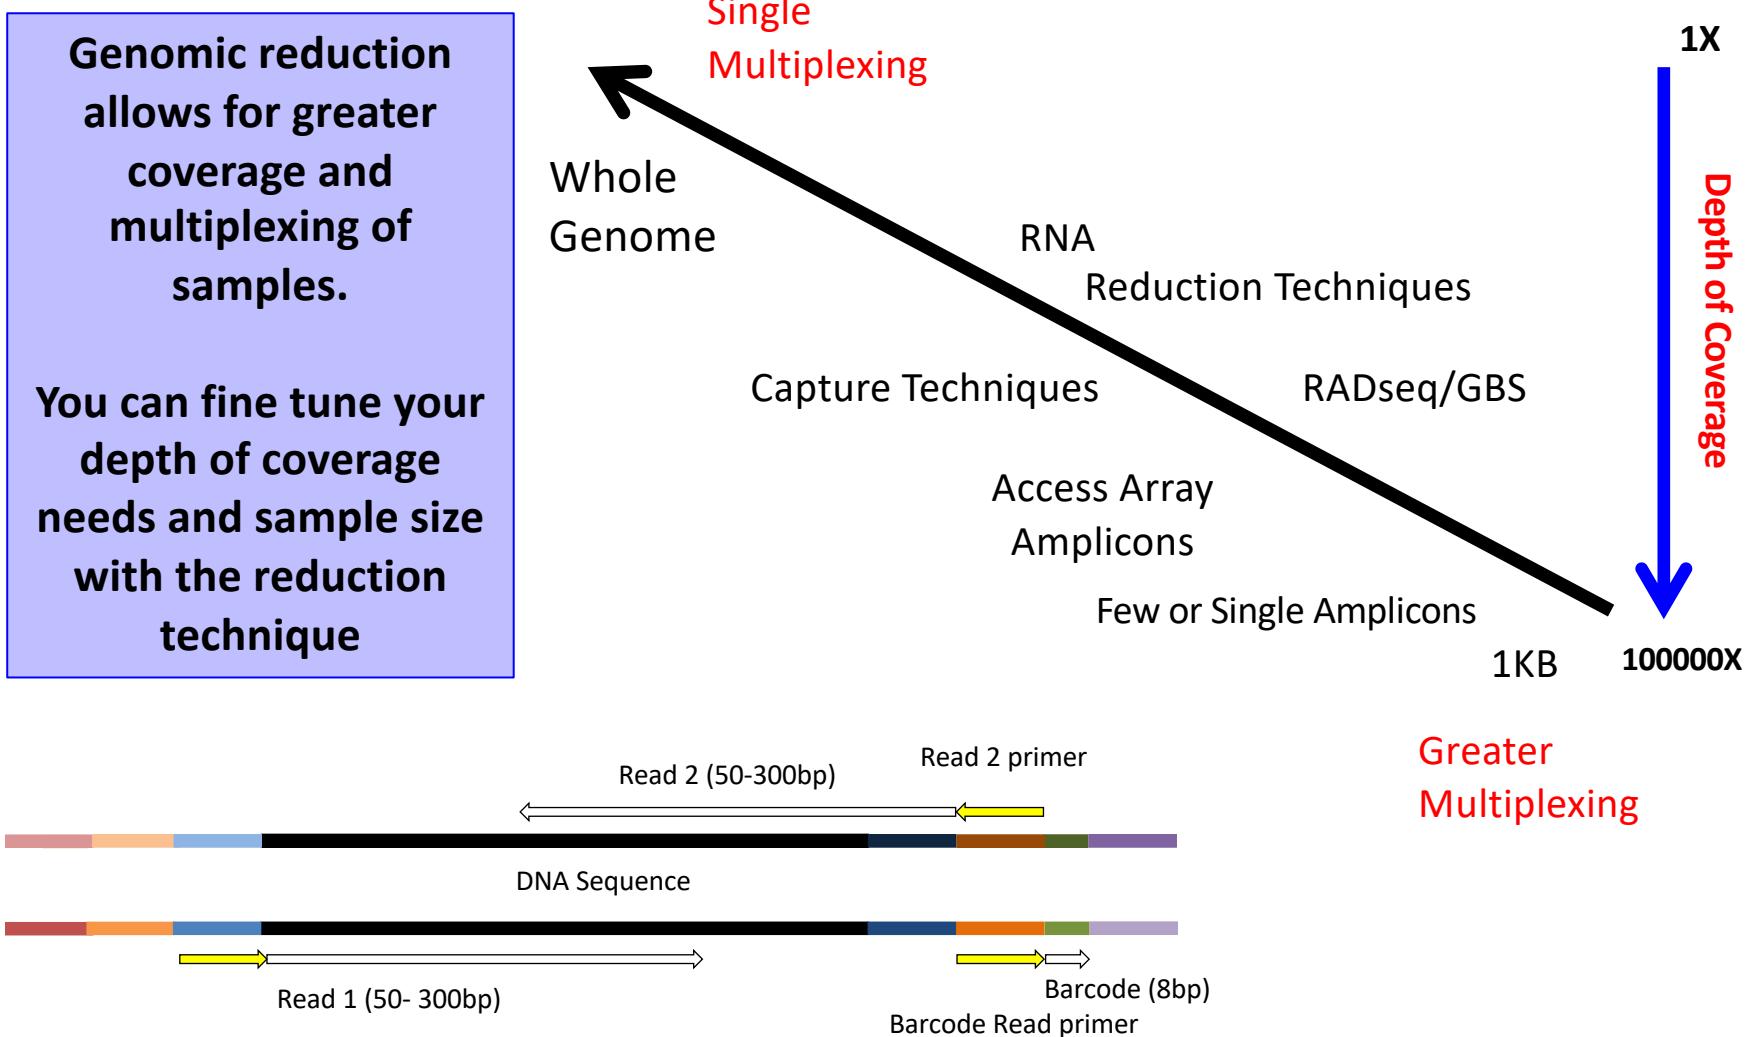

- Includes: labor, administration, management, utilities, reagents, consumables, instruments (amortized over 3 years), informatics related to sequence productions, submission, indirect costs.

Reality

- Its much more difficult than we may first think

Data Science

Data science is the process of formulating a quantitative question that can be answered with data, collecting and cleaning the data, analyzing the data, and communicating the answer to the question to a relevant audience.

7 Stages to Data Science

1. Define the question of interest
2. Get the data
3. Clean the data
4. Explore the data
5. Fit statistical models
6. Communicate the results
7. Make your analysis reproducible

1. Define the question of interest

Begin with the end in mind!

what is the question

how are we to know we are successful

what are our expectations

dictates

the data that should be collected

the features being analyzed

which algorithms should be used

2. Get the data
3. Clean the data
4. Explore the data

Know your data!

know what the source was
technical processing in producing
data (bias, artifacts, etc.)
“Data Profiling”

Data are never perfect but love your data anyway!

the collection of massive data sets often leads to unusual ,
surprising, unexpected and even outrageous.

5. Fit statistical models

Machine Learning

Over fitting is a sin against data science!

Model's should not be over-complicated

- If the data scientist has done their job correctly the statistical models don't need to be incredibly complicated to identify important relationships
- In fact, if a complicated statistical model seems necessary, it often means that you don't have the right data to answer the question you really want to answer.

6. Communicate the results
7. Make your analysis reproducible

Remember that this is ‘science’!

We are experimenting with data selections, processing, algorithms, ensembles of algorithms, measurements, models. At some point these ***must all be tested for validity and applicability*** to the problem you are trying to solve.

**Data science done well looks easy – and
that's a big problem for data scientists**

simplystatistics.org

March 3, 2015 by Jeff Leek

Bad data science (bioinformatics) also looks easy

The Data Science in Bioinformatics

Bioinformatics is not something you are taught,
it's a way of life

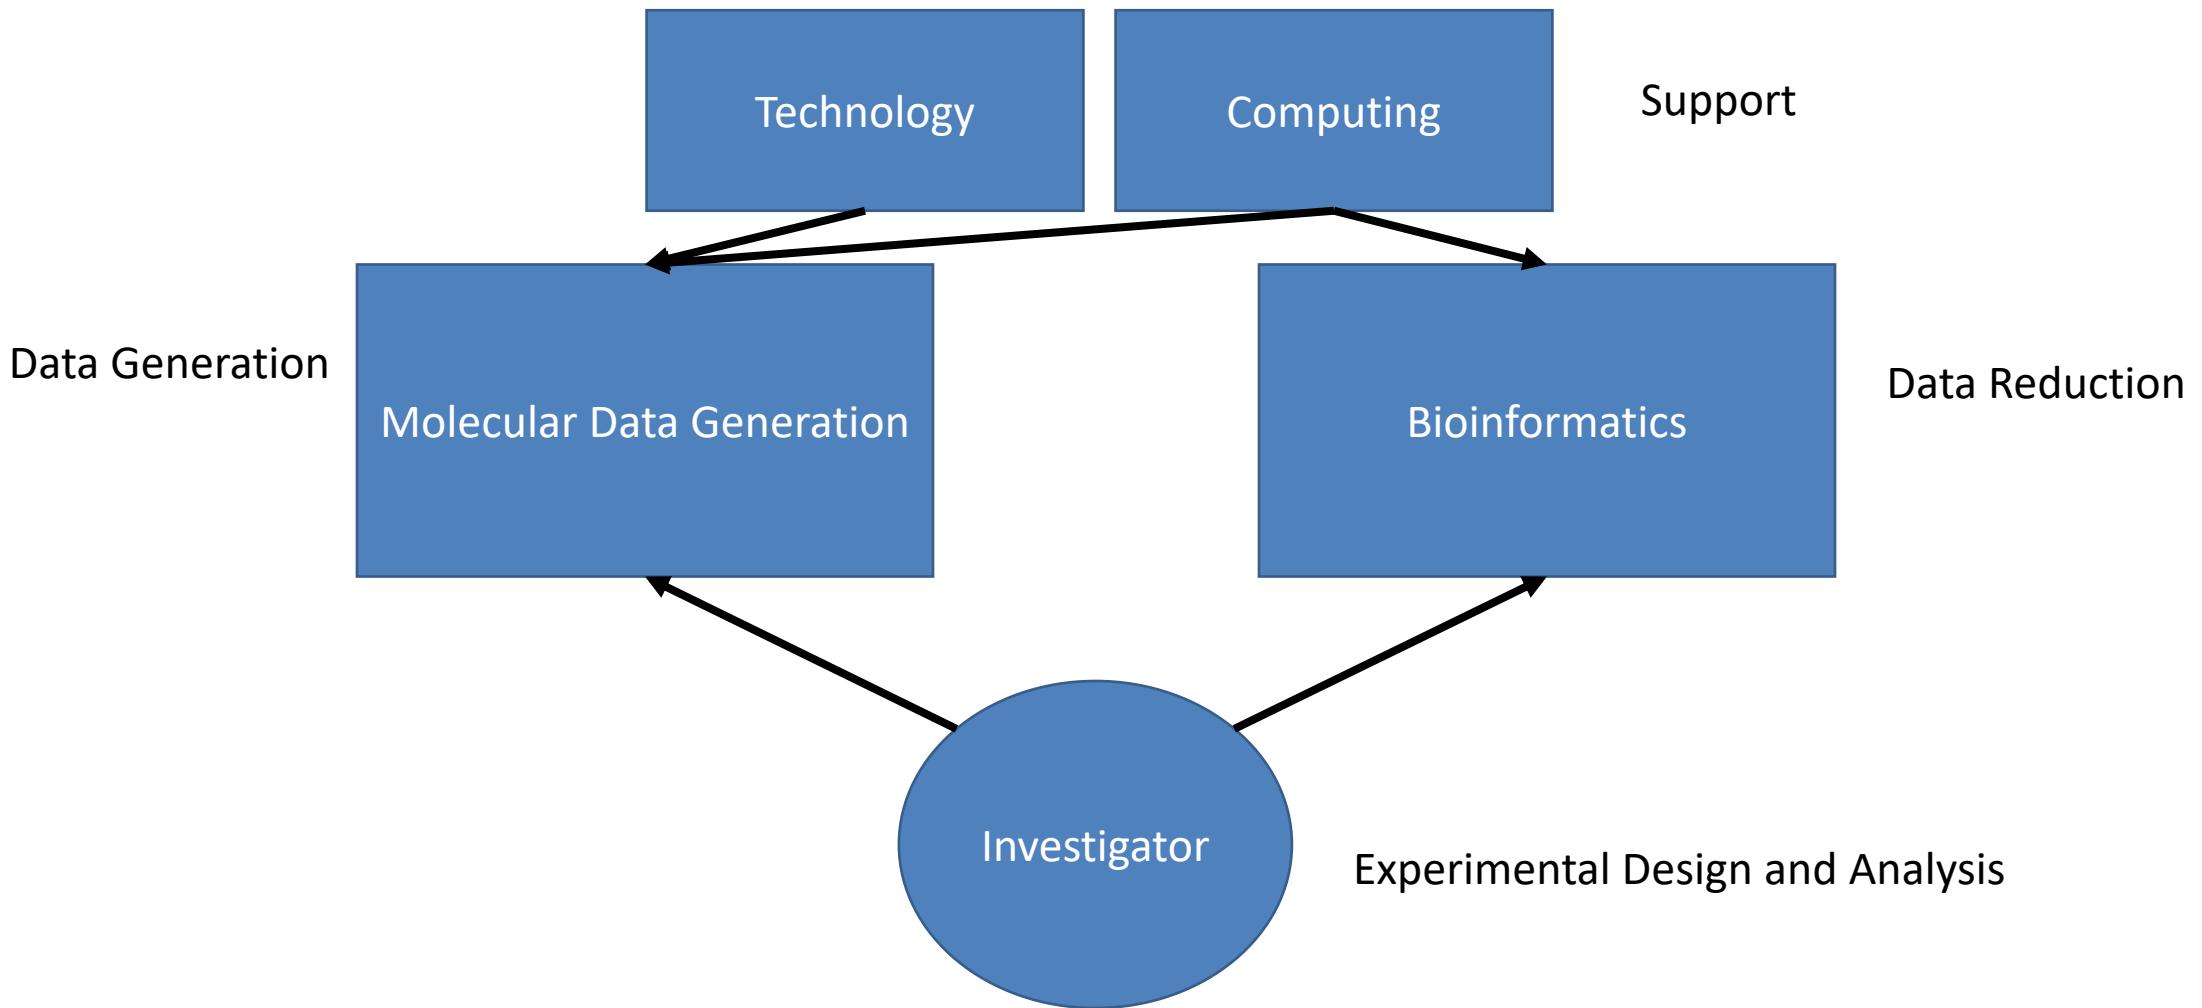

*"The best bioinformaticians I know are **problem solvers** – they start the day not knowing something, and they enjoy finding out (themselves) how to do it. It's a great skill to have, but for most, it's not even a skill – it's a passion, it's a way of life, it's a thrill. It's what these people would do at the weekend (if their families let them)."*
